

Noteplus

Alton Dupre, Kenyon Tiner, Tristan Harper, Ethan Purser

What is Noteplus

Noteplus is a note app written in C with a unique feature: its notesets exist on a per-application basis. This allows for notes to be taken in the case of applications where notes may be useful, such as in a game or productive software like video editors.

NotePlus

Why C

C is a lightweight, low level programming language, and while it may seem like overkill for a program as simple as Notepad it actually allows notepad to run as fast as it possibly can while taking up little space relative to a program written in a higher-level language.

Libraries used

Noteplus only relies on one library, SDL, however SDL is a rather important library for the project, as it allows for Noteplus to even exist by handling a bulk of the rendering logic and abstracting windows API. The extension library SDL-ttf was used to render text.
